

Appl. No. 10/809,384

Amendment dated: July 13, 2005

Reply to OA of: March 14, 2005

This listing of claims will replace all prior versions and listings of claims in the application.

Listing of Claims:

1(currently amended). A flip chip package, comprising:
a substrate having an upper surface and a lower surface, wherein the substrate has a first central area and a first peripheral area encompassing the first central area;
a chip having an active surface, wherein the active surface has a second central area and a second peripheral area encompassing the second central area;
a plurality of electrically conductive bumps connecting the first peripheral area and the second peripheral area; and
a plurality of reinforced bumps interposed between the chip and the substrate with no electrically conductive function, wherein the reinforced bump connects the first central area and the second central area.

2(original). The flip chip package of claim 1, wherein the first central area is rectangular.

3(original). The flip chip package of claim 1, wherein the first peripheral area is ring-like.

4(original). The flip chip package of claim 1, wherein the substrate further comprises a first intermediate area between the first central area and the first peripheral area, and the first intermediate area is ring-like.

Claim 5(canceled).

Appl. No. 10/809,384

Reply to OA of: March 14, 2005

6(original). The flip chip package of claim 4, wherein the first intermediate area has a width at least larger than the double of a width of the electrically conductive bump.

7(currently amended). The flip chip package of claim 51, wherein a distance between the innermost electrically conductive bump and the outermost reinforced bump is at least larger than the double of a width of the reinforced bump.

8(original). The flip chip package of claim 4, wherein the electrically conductive bump is a sphere and the first intermediate area has a width is at least larger than a diameter of the electrically conductive bump.

9(currently amended). The flip chip package of claim 51, wherein one of the reinforced bumps is a sphere and a distance between the innermost electrically conductive bump and the outermost reinforced bump is at least larger than the double of a diameter of the reinforced bump.

10(original). The flip chip package of claim 1, further comprising an underfill disposed between the chip and the substrate and covering the electrically conductive bumps.

11(original). The flip chip package of claim 1, further comprising an underfill disposed between the chip and the substrate and covering the reinforced bumps.

12(original). The flip chip package of claim 1, wherein the reinforced bumps comprises metal bumps.

13(original). The flip chip package of claim 1, wherein one of the reinforced bumps is a thermally conductive bump.

Appl. No. 10/809,384

14(original). The flip chip package of claim 1, further comprising a solder ball formed on the lower surface of the substrate.

15(original). The flip chip package of claim 4, wherein the electrically conductive bump is a sphere and the first intermediate area has a width is substantially equal to the double of a diameter of the electrically conductive bump.

16(currently amended). The flip chip package of claim 51, wherein one of the reinforced bumps is a sphere and a distance between the innermost electrically conductive bump and the outermost reinforced bump is substantially equal to the double of a diameter of the reinforced bump.

Claim 17(canceled).

18(original). The flip chip package of claim 1, wherein the reinforced bumps are made of epoxy.
